

Question 1)

$x \geq 0, y \geq 0$

Recurrence relation:

$\text{add}(x, y) = x$                       when  $y = 0$   
 $\text{add}(x, y) = 1 + \text{add}(x, y-1)$       when  $y > 0$

**Base Case:**

When  $y$  is 0, recurrence relation is  $\text{add}(x, y) = x$ , which is true

Since when we add integers  $x, y$  where  $y = 0, x + y = x$

The actual addition result and value given by recurrence relation are same.

Hence, recurrence relation is true for  $y = 0$

**Hypothesis:** Assuming the recurrence is true for  $y = k$ . where  $k > 0$

We assume, when  $y = k$

$x + y$   
 $= x + k$   
 $= 1 + \text{add}(x, k - 1)$

**Inductive Step:** Recurrence relation is true for  $y = k+1$

When we add integers  $x, y$  where  $y = k+1$

$x + y$   
 $= x + k + 1$   
 $= 1 + \text{add}(x, k) + 1$   
 $= 1 + \text{add}(x, k)$   
 $= 1 + \text{add}(x, (k+1) - 1)$   
 $= 1 + \text{add}(x, y - 1)$

Hence, recurrence is true for  $y = k+1$

Therefore

Both base case and inductive step are proved true.

Question 2)
